Programme: Master of Engineering- Computer Science and Engineering

Vision of the Department

To achieve education and research excellence in Computer Science and Engineering.

Mission of the Department

- M1: To excel in academic through effective teaching learning techniques
- M2: To promote research in the area of computer science and engineering with the focus on innovation
- M3: To transform students into technically competent professionals with societal and ethical responsibilities

Program Outcomes (POS)

PO1: An ability to independently carry out research / investigation and development work to solve practical problems.

PO2: An ability to write and present a substancial technical report/document.

- **PO3:** Students should be able to demonstrate a degree of mastery over the area asper the specialization of the program .The mastery should be at a level higher than than the requirements in the appropriate bachelor program.
- **PO4:** Ability to discriminate, evaluate, analyze and synthesize existing and new knowledge and integration of the same for enhancement of knowledge in Computer Science and Engineering.
- **PO5:** Ability to think laterally and originally to identify, formulate and solve an engineering problem in Computer Science and Engineering and effectively utilize appropriate scientific and engineering techniques and methodologies in the problem solving process.

PO6: Ability to apply the tools from optimization, probability, statistics, simulation and engineering economic analysis, including fundamental application of the tools in IT industry invoving uncertainty and scarce or expensive resources.

Program Educational Objectives (PEOs)

- **PEO 1:** To empower graduates to identify,create and solve computing problem by applying their knowledge of computing principles and mathematical theory to develop sustainable solutions to current and future computing problems.
- **PEO 2:** To develop research attitude in graduates and to explore it for higher education Endeavors and constantly upgrade their skills with an attitude towards lifelong learning.
- **PEO 3:** To facilitate graduates to acquire skills to communicate effectively with the society and contribute to the betterment of the society as a committed technical personnel.

ABSTRACT

In today's era of internet, the amount of data generation is growing on increasing. With the development of artificial intelligence, big data classification technology provides the advantageous help for the medicine auxiliary diagnosis research. While due to the different conditions in the different sample collection, the medical big data is often imbalanced.

Imbalanced data typically refers to a condition in which several data samples in a certain problem is not equally distributed, thereby leading to the underrepresentation of one or more classes in the dataset.

Traditional classification algorithms usually assume that the number of samples in each class is similar and their misclassification cost during training is equal. However, the misclassification cost of patient samples is higher than that of healthy person samples. Therefore, how to increase the identification of patients without affecting the classification of healthy individuals is an urgent problem.

The straightforward method to solve this problem is the resampling method by adding records to the minority class or deleting ones from the majority class. In this paper, we have experimented with different SMOTE oversampling and undersampling methods.

The purpose of this work is to balance the imbalanced data using different sampling techniques. We use two medical dataset i.e **PIMA INDIAN DIABETICS DATASET** and **CHRONIC KIDNEY DISEASE DATASET** download from kaggle repository.

So that in this project, split in to two phases. One is data sampling and other one is Prediction model.

In this project we used different data sampling methods like SMOTE, K-means SMOTE, SMOTENC (SMOTE for Nominal and Continuous) and SMOTEN (SMOTE for Nominal).

After getting modified data sampling dataset, to apply the different Machine learning algorithms i.e **Decision tree, Random Forest, SVM and KNN** to predict the prediction of Chronic Kidney Disease and diabetic disease in early stage.

Based on **accuracy**, **precision and Recall** value from implemented tested machine learning model to find out the best Sampling as well as machine learning algorithms.

Program Educational Objectives (PEOs)

- **PEO 1:** To empower graduates to identify,create and solve computing problem by applying their knowledge of computing principles and mathematical theory to develop sustainable solutions to current and future computing problems.
- **PEO 2:** To develop research attitude in graduates and to explore it for higher education Endeavors and constantly upgrade their skills with an attitude towards lifelong learning.
- **PEO 3:** To facilitate graduates to acquire skills to communicate effectively with the society and contribute to the betterment of the society as a committed technical personnel.

ABSTRACT

Data in its original form, however, typically contain sensitive information about the individuals. Directly publishing raw data will violate the privacy of people involved. Consequently, it becomes increasingly important to preserve the privacy of published data. An attacker is apt to identify an individual from the published tables, with attacks through the record linkage, attribute linkage, table linkage or probabilistic attack. Although algorithms based on generalization and suppression has been proposed to protect the sensitive attributes and resist these multiple types of attacks, they often suffer from large information loss by replacing specific values with more general ones. Alternatively, anatomization and permutation operations can de-link the relation between attributes without modifying them. In this paper, to propose a scheme Sensitive Label Privacy Preservation with Anatomization (SLPPA) was to protect the privacy of published data. The security analysis shows our scheme is provably secure, and the performance evaluation demonstrates the overhead of data dynamics and the dispute arbitrations are reasonable.

EXTERNAL EXAM

DECLARATION

I affirm that the Project report titled "AN ACCURATE PRDICTION OF BITCOIN PRICE USING DATA SCIENCE AND DEEP LEARNING" being submitted in partial fulfillment for the award of Master of Engineering in Computer Science and Engineering, is the original work carried out by me. It has not formed the part of any other project report or dissertation on the basis of which a degree or award was conferred on an earlier occasion on this or any other candidate.

B. Free

S.NAGA KANNIKA (927621MCS004)

I certify that the declaration made by the above candidate is true to the best of my knowledge.

Name & Signature of the supervisor with date Dr. B. Padniiki Devi

ACKNOWLEDGEMENT

Behind every achievement lies an unfathomable sea of gratitude to those who actuated it, without them it would have never came into existence, to them we lay the word of gratitude imprinted within us.

I would like to express my profuse gratitude to Thiru.M.Kumarasamy, Chairman and Dr.K.Ramakrishnan, Secretary of our college for providing extra ordinary infrastructure, which helped me in the completion of the project Phase I in time.

I wish to express my sincere thanks to our respected Dr.N.Ramesh Babu, M.E., **Ph.D.**, **Principal**, for all the blessing and help provided during the period of project work.

I explore my gratitude to Dr.M.Murugesan M.E., Ph.D., Head of the Department, Computer Science and Engineering, for permitting me to undertake this project as part of the curriculum.

I am indebted to my project supervisor Dr.B.Padmini Devi, M.E., Ph.D., Associate Professor, Computer Science and Engineering, for her constant help and creative ideas over the periods of project work.

I am thankful to my Faculty Members of Department of Computer Science and Engineering for their continuous direction and guidance and timely support extended for me to carry out my project successfully.

Words are boundless to thank Our Parents and Friends for their constant encouragement to complete this project successfully.

[S.NAGA KANNIKA]

Programme: Master of Engineering- Computer Science and Engineering

Vision of the Department

To achieve education and research excellence in Computer Science and Engineering

Mission of the Department

- M1: To excel in academic through effective teaching learning techniques
- M2: To promote research in the area of computer science and engineering with the focus on innovation
- M3: To transform students into technically competent professionals with societal and ethical responsibilities

Program Outcomes (POS)

- **PO1:** An ability to independently carry out research / investigation and development work to solve practical problems.
- PO2: An ability to write and present a substancial technical report/document.
- **PO3:** Students should be able to demonstrate a degree of mastery over the area asper the specialization of the program .The mastery should be at a level higher than than the requirements in the appropriate bachelor program.
- **PO4:** Ability to discriminate, evaluate, analyze and synthesize existing and new knowledge and integration of the same for enhancement of knowledge in Computer Science and Engineering.
- **PO5:** Ability to think laterally and originally to identify,formulate and solve an engineering problem in Computer Science and Engineering and effectively utilize appropriate scientific and engineering techniques and methodologies in the problem solving process.

PO6: Ability to apply the tools from optimization, probability, statistics, simulation and engineering economic analysis, including fundamental application of the tools in IT industry invoving uncertainty and scarce or expensive resources.

Program Educational Objectives (PEOs)

- **PEO 1:** To empower graduates to identify,create and solve computing problem by applying their knowledge of computing principles and mathematical theory to develop sustainable solutions to current and future computing problems.
- **PEO 2:** To develop research attitude in graduates and to explore it for higher education Endeavors and constantly upgrade their skills with an attitude towards lifelong learning.
- **PEO 3:** To facilitate graduates to acquire skills to communicate effectively with the society and contribute to the betterment of the society as a committed technical personnel.

ABSTRACT

Bitcoin uses a peer-to-peer technology to operate with no central authority or banks. Bitcoin is open-source; its design is public, nobody owns or controls Bitcoin and everyone can take part. Digital currency brings into use as open source software in pseudonymous creator Satoshi Nakamoto It is a crypto currency, so-called because it uses cryptography to control the creation and transfer of money. The goal of this work is to compare the accuracy of bitcoin price in USD prediction based on Long Short-term Memory (LSTM) network with self-attention. Real-time price data is collected by Pycurl from Bitfine. LSTM model is implemented by Keras and TensorFlow. The proposed model used in this work is mainly to present a classical comparison of time series forecasting, as expected, it could make efficient prediction limited in short-time interval, and the outcome depends on the time period. The LSTM could reach a better performance, with extra, indispensable time for model training, especially via CPU.

ABSTRACT

In today's era of internet, the amount of data generation is growing on increasing. With the development of artificial intelligence, big data classification technology provides the advantageous help for the medicine auxiliary diagnosis research. While due to the different conditions in the different sample collection, the medical big data is often imbalanced. Traditional classification algorithms usually assume that the number of samples in each class is similar and their misclassification cost during training is equal. However, the misclassification cost of patient samples is higher than that of healthy person samples. Therefore, how to increase the identification of patients without affecting the classification of healthy individuals is an urgent problem. The straightforward method to solve this problem is the resampling method by adding records to the minority class or deleting ones from the majority class. In this project, we have experimented with different SMOTE oversampling methods. The purpose of this work is to balance the imbalanced data using different sampling techniques. We use two medical dataset i.e PIMA INDIAN DIABETICS DATASET and CHRONIC KIDNEY DISEASE DATASET download from kaggle repository. So that in this project, split in to two phases. One is data sampling and other one is Prediction model. In this project we used different data sampling methods like SMOTE, K-means SMOTE, SMOTENC (SMOTE for Nominal and Continuous) and SMOTEN (SMOTE for Nominal). After getting modified data sampling dataset, to apply the different Machine learning algorithms i.e Decision tree, Random Forest, SVM and KNN to predict the prediction of Chronic Kidney Disease and diabetic disease in early stage. Based on Accuracy, Precision and Recall value from implemented tested machine learning model to find out the best Sampling as well as machine learning algorithms.

growing on increasing. With the development of artificial intelligence, big data classification technology provides the advantageous help for the medicine auxiliary diagnosis research. While due to the different conditions in the different sample collection, the medical big data is often imbalanced. Traditional classification algorithms usually assume that the number of samples in each class is similar and their misclassification cost during training is equal. However, the misclassification cost of patient samples is higher than that of healthy person samples. Therefore, how to increase the identification of patients without affecting the classification of healthy individuals is an urgent problem. The straightforward method to solve this problem is the resampling method by adding records to the minority class or deleting ones from the majority class. In this project, we have experimented with different SMOTE oversampling methods. The purpose of this work is to balance the imbalanced data using different sampling techniques. We use two medical dataset i e PIMA INDIAN DIABETICS DATASET and CHRONIC KIDNEY DISEASE DATASET download from kaggle repository. So that in this project, split in to two phases. One is data sampling and other one is Prediction model. In this project we used different data sampling methods like SMOTE, K-means SMOTE, SMOTEN (SMOTE for Nominal). After getting modified data sampling dataset, to apply the different Machine learning hlogorithms i.e Decision tree, Random Forest, SVM and KNN to predict the prediction of Chronic Kidney Disease and diabetic lisease in early stage.
